Business StoryTelling with Data - Sales Performance Analysis

INSIGHTS

1. Average Discounted Price – Area Chart

Top left

Observation:

- The chart shows a declining trend in average discounted price across the displayed categories.
- The initial categories have higher average prices.
- The average price decreases significantly in the middle and becomes relatively stable towards the end.

Interpretation:

- A small number of categories account for higher average discounted prices.
- The decline indicates that most of the remaining categories have comparatively lower-priced products.
- This suggests that product pricing is not evenly distributed.

Recommendation:

- Focus on promoting higher-value products to improve revenue.
- Review pricing strategies for lower-priced products.
- Consider product bundles and promotional offers to increase average purchase value.

2. Rating Level – Slicer

Top middle

Observation:

- The dashboard provides different customer rating levels.
- Users can select a rating level to filter the dashboard.

Interpretation:

- Customer ratings help understand product satisfaction.
- Comparing products across rating levels helps identify highly rated and poorly rated products.

Recommendation:

- Monitor products with lower customer ratings.
- Investigate negative customer feedback to identify product-quality or service issues.
- Promote products with consistently higher ratings.

3. Product Price vs Customer Rating – Bar Chart

Top right

Observation:

- The chart compares product-related values across multiple products.
- A few products have significantly higher bars than the remaining products.
- Most products show comparatively smaller values.

Interpretation:

- Product performance varies considerably.
- Some products stand out from the rest, while several products have relatively similar performance.
- Price and customer rating should be evaluated together rather than assuming that higher-priced products always receive better ratings.

Recommendation:

- Identify products that combine competitive pricing with high customer ratings.
- Improve products with weaker customer ratings.
- Use customer feedback when making product pricing and marketing decisions.

4. Sum of Actual Price – KPI Card

Middle

Observation:

- The dashboard displays the total actual price as approximately 495.3K.

Interpretation:

- This represents the aggregated actual-price value for the currently selected dataset and filters.
- It provides an overview of the overall product value represented in the dataset.

Recommendation:

- Monitor actual-price totals regularly.
- Compare actual prices with discounted prices to understand the impact of discounts.
- Use this metric to evaluate overall pricing performance.

5. Product Name – Slicer

Bottom middle

Observation:

- The dashboard includes a product-name filter.
- Users can select an individual product to view its related performance.

Interpretation:

- Product-level filtering makes it easier to analyze individual product performance.
- It helps compare pricing and customer ratings without reviewing the entire dataset.

Recommendation:

- Use this filter to investigate individual product performance.
- Identify products with high prices but comparatively low customer ratings.
- Review product-specific pricing and customer feedback before making business decisions.

6. Actual Discount – Gauge Chart

Middle right

Observation:

- The gauge visual displays the actual discount metric.
- The indicator is approximately 24 according to the visible screenshot.

Interpretation:

- The gauge provides a quick understanding of the discount level against its configured target or scale.
- It helps identify whether the displayed discount is relatively low or high within the selected range.

Recommendation:

- Maintain competitive discount levels.
- Avoid excessive discounts that may reduce profitability.
- Evaluate whether discounts are improving customer purchases and product performance.

Note: Confirm whether the gauge represents a percentage or an absolute value before documenting the final metric.

7. Price Discount vs Actual Price – Bar Chart

Bottom right

Observation:

- The chart compares the sum of price discount and actual price.
- The actual-price bar is visibly longer than the price-discount bar.
- There is a noticeable difference between the two values.

Interpretation:

- The comparison highlights the difference between product pricing and discounted pricing.
- It helps understand how much prices have been reduced through discounts.
- Discounting plays an important role in the overall pricing strategy.

Recommendation:

- Evaluate discount levels across different products.
- Focus on discounts that improve sales without significantly affecting profit margins.

- Review products with unusually large differences between actual and discounted prices.

8. KPI Cards – Bottom Left

Bottom left

Your screenshot shows five KPI cards, but their individual titles and values are too small to read accurately.

For these cards, use the following structure according to their actual metric names:

KPI type	Observation / Interpretation	Recommendation
Total Products	Shows the number of products available in the dataset.	Expand product variety based on customer demand.
Average Rating	Indicates the overall customer rating level.	Improve product quality and customer satisfaction.
Total Reviews	Represents customer feedback volume.	Encourage customers to provide genuine reviews.
Average Discount	Indicates the average discount offered.	Optimize discounts to balance sales and profitability.
Product Count / Category Count	Shows the distribution of products.	Identify opportunities in underrepresented categories.
